## Parameters of Gases

The characteristics of gases are described in terms of following four parameters

- Mass, Volume, Pressure, and Temperature

1. Mass (m):

The mass of the gas is related to the number of moles as

$$
n=\frac{w}{M}
$$

Where $\mathrm{n}=$ number of moles
Note/ One mole of material contains Avogadro's number ( $6.023 \times 10^{23}$ ) atoms
$\mathrm{w}=$ mass of gas in grams
$\mathrm{M}=$ molecular mass of the gas
Q1) how many atoms in 8 grams of helium.

## 2. Volume (V):

Since gases occupy the entire space available to them, therefore the gas volume means the volume of the container in which the gas is enclosed.

Units of Volume: Volume is generally expressed in liter (L), $\mathbf{c m}^{\mathbf{3}} \& \mathbf{d m}^{\mathbf{3}}$
$1 \mathrm{~m}^{3}=10^{3}$ liter $=10^{3} \mathrm{dm}^{3}=10^{6} \mathrm{~cm}^{3}$.
3. Pressure:

Pressure of the gas is due to its collisions with walls of its container i.e. the force exerted by the gas per unit area on the walls of the container is equal to its pressure.

$$
P(\text { pressure })=\frac{F(\text { Force })}{A(\text { Area })}=\frac{\text { Mass } \times \text { Accelaration }}{\text { Area }}
$$

Pressure is exerted by a gas due to kinetic energy of its molecules.

## Units of Pressure:

The pressure of a gas is expressed in $\mathbf{m m}$ of $\mathrm{Hg}, \mathbf{a t m}, \mathbf{P a}, \mathbf{N m}^{-\mathbf{2}}$, bar and $\mathbf{l b / I n} \mathbf{n}^{\mathbf{2}}(\mathbf{p s i})$.

760 mm of $\mathrm{Hg}=1 \mathrm{~atm}=101325 \mathrm{~Pa}=101325 \mathrm{Nm}^{-2}$
760 mm of $\mathrm{Hg}=760$ Torr $=1.01325 \mathrm{bar}=14.7 \mathrm{lb} / \mathrm{ln}^{2}(\mathrm{psi})$

## 3. Temperature (T):

Temperature is defined as the degree of hotness. The SI unit of temperature is Kelvin. ${ }^{\circ} \mathrm{C}$ and ${ }^{\circ} \mathrm{F}$ are the two other units used for measuring temperature. On the Celsius scale water freezes at $0^{\circ} \mathrm{C}$ and boils at $100^{\circ} \mathrm{C}$ where as in the Kelvin scale water freezes at 273 K and boils at 373 K .
$\mathrm{K}={ }^{\circ} \mathrm{C}+\mathbf{2 7 3 . 5}$
$\mathrm{F}=(9 / 5){ }^{\circ} \mathrm{C}+32$
Q2) what is the difference between temperature and heat?
Heat (symbol: q) is energy. It is the total amount of energy (both kinetic and potential) possessed by the molecules in a piece of matter. Heat is measured in Joules.

## The Units of measurement

The international system of units (SI) was adopted by the General Conference on Weights and Measure in 1960, and the SI units are widely used today. All SI units are based on these basic units.

| Seven Basic Quantities and Units |  |  |
| :---: | :---: | :---: |
| Quantity | Unit | Symbol |
| Length | Meter | m |
| Mass | Kilogram | kg |
| Time | Second | s |
| Electric current | Ampere | A |
| Temperature | Kelvin | K |
| Luminous intensity | Candela | cd |
| Amount of substance | Mole | mol |

Other units are called derived units the table below lists some examples:

| Derived quantities and their SI units |  |  |
| :---: | :---: | :---: |
| Quantity | Unit | Symbol |
| Area | square meter | $\mathrm{m}^{2}$ |
| Volume | cubic meter | $\mathrm{m}^{3}$ |
| Density | kg per cubic meter | $\mathrm{kg} \mathrm{m}^{-3}$ |
| Velocity | meter per second | $\mathrm{m} \mathrm{s}^{-1}$ |
| acceleration | meter per second per second | $\mathrm{m} \mathrm{s}^{-2}$ |

For some specific common quantities, the SI units have special symbols.

| Special symbols of some SI units |  |  |
| ---: | :---: | :---: |
| Quantity | Unit | Explanation |
| Force | N | Newton $=\mathrm{kg} \mathrm{m} \mathrm{s}^{-2}$ |
| Pressure | Pa | Pascal $=\mathrm{N} \mathrm{m}^{-2}$ |
| Electric potential | V | Volt $=\mathrm{J} / \mathrm{C}$ |
| Energy | J | Joule $=\mathrm{N} . \mathrm{m}$ |
| Electric charge | C | Coulomb $=\mathrm{A} \mathrm{s}$ |
| Electric potential | V | $1 \mathrm{~V}=1 \mathrm{~J} / \mathrm{C}$ |
| Power | watt | 1 watt $=1 \mathrm{~J} / \mathrm{s}$ |

The following units are still in common use for chemistry

| Common units still in Use |  |  |
| :---: | :---: | :---: |
| Quantity | Symbol | Explanation |
| Volume | L | liter $=1 \mathrm{dm}^{3}, 1 \mathrm{dm}=0.1 \mathrm{~m}$ |
| Volume | mL | milliliter $=1 / 1000 \mathrm{~L}$ |
| Molarity | M | number of moles dissolved in 1 liter solution |
| Molality $*$ | m | number of moles dissolved in 1 kg solvent |

## SI unit prefixes

Metric system or SI units are based on factors of ten. However, most units prefixes with names are 1000 times apart. The exception are near the base unit (centi-, deci-, kilo-, ).

| SI unit prefixes |  |  |
| :--- | :--- | :--- |
| Factors | Prefix | Symbol |
| $10^{12}$ | tera | T |
| $19^{9}$ | giga | G |
| $10^{6}$ | mega | M |
| $10^{3}$ | kilo | k |
| $10^{2}$ | hecto | h |
| $10^{1}$ | deca | da |
| $10^{-1}$ | deci | d |
| $10^{-2}$ | centi | c |
| $10^{-3}$ | milli | m |
| $10^{-6}$ | micro | $\mathrm{\mu}$ |
| $10^{-9}$ | nano | n |
| $10^{-12}$ | pico | p |
| $10^{-15}$ | femto | f |
| $10^{-18}$ | atto | a |

## Conversion Factors

A conversion factor is a ratio of equivalent quantities used to express a quantity in different units.

Ex// How many cm are in 1.32 meters?

$$
\begin{gathered}
\frac{1 \mathrm{~m}}{100 \mathrm{~cm}} \text { or } \frac{100 \mathrm{~cm}}{1 \mathrm{~m}} \text { Unit conversation } \\
\mathrm{X} \mathrm{~cm}=1.32 \mathrm{~m}\left(\frac{100 \mathrm{~cm}}{1 \mathrm{~m}}\right)=132 \mathrm{~cm}
\end{gathered}
$$

| Common conversion factors |  |  |  |
| :---: | :---: | :---: | :---: |
| Quantity | SI Unit | Other Unit | Conversion Factor |
| Energy | joule | calorie erg | $\begin{aligned} & 1 \mathrm{cal}=4.184 \mathrm{~J} \\ & 1 \mathrm{erg}=10^{-7} \mathrm{~J} \end{aligned}$ |
| Force | newton | dyne | $1 \mathrm{dyn}=10^{-5} \mathrm{~N}$ |
| Length | metre or meter | ångström | $\begin{aligned} & 1 \AA=10^{-10} \mathrm{~m}=10^{-8} \mathrm{~cm}=10^{-} \\ & { }^{1} \mathrm{~nm} \end{aligned}$ |
| Mass | kilogram | pound | $1 \mathrm{lb}=0.453592 \mathrm{~kg}$ |
| Pressure | pascal | bar atmosphere mm Hg $\mathrm{lb} / \mathrm{in}^{2}$ | $\begin{aligned} & 1 \mathrm{bar}=10^{5} \mathrm{~Pa} \\ & 1 \mathrm{~atm}=1.01325 \times 10^{5} \mathrm{~Pa} \\ & 1 \mathrm{~mm} \mathrm{Hg}=133.322 \mathrm{~Pa} \\ & 1 \mathrm{lb} / \mathrm{in}^{2}=6894.8 \mathrm{~Pa} \\ & \hline \end{aligned}$ |
| Temperature | kelvin | Celsius <br> Fahrenheit | $\begin{aligned} & 1^{\circ} \mathrm{C}=1 \mathrm{~K} \\ & 1^{\circ} \mathrm{F}=5 / 9 \mathrm{~K} \\ & \hline \end{aligned}$ |
| Volume | cubic metre | litre <br> gallon (U.S.) <br> gallon <br> (U.K.) <br> cubic inch | $\begin{aligned} & 1 \mathrm{~L}=1 \mathrm{dm}^{3}=10^{-3} \mathrm{~m}^{3} \\ & 1 \mathrm{gal}(\mathrm{U} . \mathrm{S} .)=3.7854 \times 10^{-} \\ & 3 \mathrm{~m}^{3} \\ & 1 \mathrm{gal}(\text { U.K. })=4.5641 \times 10^{-} \\ & 3 \mathrm{~m}^{3} \\ & 1 \mathrm{in}^{3}=1.6387 \times 10^{-6} \mathrm{~m}^{3} \end{aligned}$ |

Note// we use the idea of unit cancellation to decide upon which one of the two conversion factors we choose.
Ex// How many meters is 8.72 cm ?

Again, the units must cancel.
$\qquad$

Ex// Convert $41.2 \mathrm{~cm}^{2}$ to $\mathrm{m}^{2}$.

$$
\begin{aligned}
X \mathrm{~m}^{2} & =41.2 \mathrm{~cm} \cdot \mathrm{~cm}\left(\frac{1 \mathrm{~m}}{100 \mathrm{~cm}}\right)\left(\frac{1 \mathrm{~m}}{100 \mathrm{~cm}}\right) \\
& =0.00412 \mathrm{~m}^{2} \\
X \mathrm{~m}^{2} & =41.2 \mathrm{~cm}^{2}\left(\frac{1 \mathrm{~m}}{100 \mathrm{~cm}}\right)^{2}=0.00412 \mathrm{~m}^{2}
\end{aligned}
$$

Ex// Convert 2 atm to pressure uints $\mathbf{P a}$, and $\mathbf{m m}$ of $\mathbf{H g}$,?

$$
\begin{gathered}
\frac{1 \mathrm{~atm}}{101325 \mathrm{pa}} \text { or } \frac{101325}{1 \mathrm{~atm}} \mathrm{pa}_{\text {Unit conversation }} \\
\mathrm{X} \mathrm{pa}=8.72 \mathrm{~atm}\left(\frac{101325 \mathrm{pa}}{1 \mathrm{~atm}}\right)=202650 \mathrm{pa} \\
\mathrm{X} \mathrm{~mm} \text { of } \mathrm{Hg}=8.72 \mathrm{~atm}\left(\frac{760 \mathrm{~mm}}{1 \mathrm{~atm}}\right)=1520 \mathrm{~mm}
\end{gathered}
$$

## Converting Units of Temperature

Ex// A child has a body temperature of $38.7^{\circ} \mathrm{C}$, and normal body temperature is $98.6^{\circ} \mathrm{F}$. Does the child have a fever? What is the child's temperature in kelvins?

## SOLUTION:

Converting from ${ }^{\circ} \mathrm{C}$ to ${ }^{\circ} \mathrm{F} \quad \frac{9}{5}\left(38.7^{\circ} \mathrm{C}\right)+32=101.7^{\circ} \mathrm{F}$
Yes, the child has a fever.

Converting from ${ }^{\circ} \mathrm{C}$ to K
$38.7^{\circ} \mathrm{C}+273.15=311.8 \mathrm{~K}$

EX// change 806 mmHg to (a) torr (b) atmosphere (c) kilopascals.

Home work) convert
$1-1.49 \times 10^{3} \mathrm{mg}$ to gm
2- $4.6 \mathrm{~cm}^{3}$ to $\mathrm{m}^{3}$
3-1.07 bar to torr

## Unit analysis

Unit analysis is also a useful guard against algebraic mistakes. An error in setting up an algebraic solution often changes the units of the answer, and check of the answer's units will show the mistake.

PROBLEM Unit analysis and recognition of a reasonable value can prevent errors such as those that resulted in the following answers. Identify the problem with these results for the requested quantity:

```
Quantity
the density of NaCl(s)
the density of NaCl(s)
bond length of CsI
speed of a molecule
momentum of electron
```

Wrong answer
$1.3 \cdot 10^{-24} \mathrm{~g} \mathrm{~cm}^{-3}$
$3.3 \cdot 10^{7} \mathrm{~g} \mathrm{~cm}^{-1}$
12.3 m
$4.55 \cdot 10^{11} \mathrm{~m} \mathrm{~s}^{-1}$
$5 \cdot 10^{-10} \mathrm{~m} \mathrm{~s}^{-1}$

SOLUTION Each of those examples gives an answer of entirely the wrong magnitude (which could arise from using the wrong conversion factor, the wrong units, or both).

| Quantity | Wrong answer | Why unreasonable |
| :--- | :--- | :--- |
| the density of $\mathrm{NaCl}(\mathrm{s})$ | $1.3 \cdot 10^{-24} \mathrm{~g} \mathrm{~cm}^{-3}$ | too small |
| the density of $\mathrm{NaCl}(\mathrm{s})$ | $3.3 \cdot 10^{7} \mathrm{~g} \mathrm{~cm}^{-1}$ | wrong units |
| bond length of CsI | 12.3 m | too big |
| speed of a molecule | $4.55 \cdot 10^{11} \mathrm{~m} \mathrm{~s}^{-1}$ | too big (greater than speed of light) |
| momentum of electron | $5 \cdot 10^{-10} \mathrm{~m} \mathrm{~s}^{-1}$ | wrong units |
